Welcome to Valid Points!

We've spent the past several weeks of this newsletter wading into deep technical and philosophical debates around future of Ethereum – with topics ranging from maximal extractable value (MEV), to the threat of censorship on Ethereum, to what makes a 'true' zero-knowledge Ethereum Virtual Machine, or zkEVM.

But now, at long last, the Ethereum Merge is finally around the corner. This week, I'd like to take a step back and quickly address a few of the myths and

misconceptions that have popped up surrounding the Merge, Ethereum's transition to proof-of-stake scheduled for around Sept. 15.

The high-level questions below are excerpted from [a much longer FAQ](#).

I'd also like to request input from the Valid Points Community. **If you have any questions that are not answered in the FAQ – no matter how technical – please send them along in response to this email.**

– [Sam Kessler](#)

Ethereum Merge FAQ: Everything You Need to Know About the Blockchain's Coming Overhaul

(Camylla Battani/Unsplash)

Will Ethereum fees decrease after the Merge?

No.

Ethereum transaction fees are not expected to change as a result of the Merge. Future network updates, like [danksharding and proto-danksharding](#), may help to address Ethereum's high network fees, but these updates are not expected until 2023 at the earliest.

The main salve for Ethereum's transaction fee woes remains [rollups](#) – third-party networks like Arbitrum and Optimism that bundle transactions and process them separately from Ethereum's mainnet.

Will Ethereum transaction speeds increase after the Merge?

Yes, but barely.

On average, Ethereum blocks are issued [once every 13 or 14 seconds](#) in today's proof-of-work (PoW) system. After the merge, proof-of-stake (PoS) blocks will be issued in regular 12-second intervals. This is not an improvement that most users will notice, and it still places Ethereum behind rival blockchain networks like Solana and Avalanche (though well ahead of Bitcoin, where a new block is mined every [10 minutes on average](#)).

Just like with transaction fees, those looking for improved transaction speeds will need to look to Ethereum's [third-party rollups](#).

Will the Merge increase the price of ether (ETH)?

It's hard to say.

With so many variables and unknowns, it is impossible to predict what will happen to Ethereum's token price as a result of the Merge.

The Ethereum community has for years positioned the Merge as a massive upgrade to the network's core technology. Along with addressing concerns about the network's environmental impact, PoS will introduce a new form of utility for Ethereum's native ether (ETH) token in the form of staking.

But the Merge is not guaranteed to boost the ETH price. The Merge will also introduce changes to the rate at which ether is issued and how it is distributed. These changes could be positive or negative depending upon whom you ask. There is also a risk (however small) that the Merge will fail, or that PoS will prove less secure than PoW.

There is also speculation the Merge has already been priced in by the market.

Is proof-of-stake better than proof-of-work?

There are trade-offs.

According to the Ethereum Foundation, the nonprofit that funds Ethereum ecosystem development, PoS will [cut Ethereum's energy usage](#) by around 99.95%. PoS advocates also argue that PoW mining centralizes control in the hands of those who can afford to buy fancy crypto mining rigs, called ASICs. They say PoS – which hands network control to those who “stake” crypto with the network – makes attacks economically infeasible and self-defeating.

PoW proponents counter that PoS staking carries its own centralization and security risks, making it possible for malicious actors to directly “buy” control of the network. They also point out that PoS is a less battle-tested system than PoW, which has proven resilient as the backbone of the two largest blockchain networks.

[Read the full FAQ here.](#)

Calling all Solidity Sifus! Klaytn's flagship global [virtual hackathon](#) is now open for submission. With over **US\$1 million in prizes** across a prize pool of \$300,000, Sponsors' Challenge bounties, grant funding, and incubation opportunities, this is a hackathon you don't want to miss.

Why build on Klaytn?

- Klaytn is South Korea's dominant blockchain, giving you access to one of Asia's most crypto-savvy nations.
- Ethereum equivalence means building on Klaytn is simple, with the same code and toolings you know and love.
- With 1-second block time and instant finality, Klaytn has one of the lowest transaction latencies in the market.

Validated Takes

Binance to stop supporting USDC.

- **WHY IT MATTERS:** Binance, the issuer of the third-biggest stablecoin and the world's largest cryptocurrency exchange, both by volume, said it will convert all investments in USDC into its Binance USD (BUSD) token on Sept. 29. After the date, customers transferring their USDC to Binance will see the tokens be automatically converted into Binance's stablecoin. However, customers will be able to withdraw money denominated in USDC. USDC's \$52 billion market value leads BUSD's \$19 billion. [**Read more here.**](#)

The Merge is officially underway.

- **WHY IT MATTERS:** Activated on Tuesday, the Bellatrix upgrade is the network's final "hard fork" before the Merge. The activation of the Bellatrix upgrade on the Ethereum blockchain triggers the beginning of the Merge, which will likely be completed sometime around Sept. 13-16. It prepares Ethereum's proof-of-stake Beacon Chain – also called its Consensus layer – for a Merge with Ethereum's mainnet Execution layer. [**Read more here.**](#)

Aave stopped loaning ETH ahead of the Merge.

- **WHY IT MATTERS:** Between Aug. 30 and Sept. 2, the Aave community overwhelmingly voted to stop loaning ether, setting aside democratized finance's free market principle to mitigate protocol-wide risks that may arise from crypto traders betting on the Merge, Ethereum blockchain's upcoming technological overhaul. "Ahead of the Ethereum Merge, the Aave protocol faces the risk of high utilization in the ETH market. Temporarily pausing ETH borrowing will mitigate this risk of high utilization," the proposal highlighted by research firm Block Analitica said. [**Read more here.**](#)

Welcome to Valid Points!

CoinDesk started this newsletter around two years ago to track Ethereum's progress toward "the Merge," its update to a new, greener method for processing transactions.

Back then, the network's shift to proof-of-stake was called ETH 2.0, but much has changed after years of design tweaks, development cycles and extensive testing. Now, the network's shift away from its old miner-based mechanism, proof-of-work, is finally scheduled to happen around 15 hours after we hit "publish" on this newsletter.

If you're like us and are eager to follow along as the Merge approaches, there's no need to be overwhelmed. Let us walk you through how we'll be able to tell whether the upgrade was a success.

– [Sam Kessler](#)

The Essay

Timing of the Merge

Rather than a specific time, Ethereum's Merge is scheduled around something called its Terminal Total Difficulty number – a value representing the cumulative difficulty of all blocks that have ever been mined under the network's proof-of-work system.

The TTD number has been set at 5875000000000000000000, but you don't need to do the math yourself in order to figure out what this means in human time.

To keep tabs on the Merge, one can bookmark websites like bordel.wtf and wenmerge.com, which both feature live estimates for when the upgrade will happen. Even easier, you can look up "When is the Ethereum Merge?" on Google, and you'll be greeted with a big, fat countdown timer.

At press time, most estimates are placing the Merge around 4:23 UTC on Thursday – late into the evening (around midnight Thursday morning) if you are on the east coast of North America. (We only have an estimate because Ethereum proof-of-work blocks fluctuate in difficulty, and they aren't issued at a set interval).

Block proposals

Ben Edgington, a product lead at the Ethereum research and development firm ConsenSys, told CoinDesk that the first thing he'll be paying attention to when the Merge happens is whether or not blocks of transactions are being proposed to Ethereum's proof-of-stake chain.

Recall that Ethereum is a decentralized ledger – a balance sheet that gets updated by a disintermediated community of volunteers, called "validators." Every 12 seconds under Ethereum's new system, a validator will be randomly selected to propose a "block" to the chain – a list of transactions that it wants to write into the ledger.

"We expect a block like clockwork every 12 seconds on the proof-of-stake chain. Every 'slot,' which is a 12-second interval, a validator is chosen by the protocol to propose a block for that slot. If that validator is offline, is on a different fork, or is otherwise not participating correctly, then that block goes missing," Edgington explained.

One can view this data on chain explorers like beaconcha.in or beaconscan.com. Both sites list every new slot as it happens, along with whether or not a block has been proposed for it.

"Immediately, we will 'see empty slot, empty slot empty slot,' and that would be the first sign of trouble. If we see 'block, block, block, block, block,' then we know we're good," Edgington explained.

A few missed slots, according to Edgington, are “not immediately calls for desperate concern.”

Over the past few months, several Ethereum test networks (testnets) have undergone their own transitions from proof-of-work to proof-of-stake – each serving as a kind of dress rehearsal for the real thing.

Validated Takes

[The CoinDesk Market Index has been unveiled.](#)

- **WHY IT MATTERS:** CoinDesk Indices on Friday rolled out a new broad-market gauge of digital asset prices, the CoinDesk Market Index. The media company hopes the CoinDesk Market Index could become an industry benchmark similar to the stock market's Dow Jones Industrial Average or Standard & Poor's 500. The CoinDesk Market Index is first in a family of nine new price indices built around the media company's Digital Asset Classification Standard for categorizing bitcoin, ether and other digital assets. [Read more here.](#)

[Binance to issue "soulbound" tokens.](#)

- **WHY IT MATTERS:** The cryptocurrency exchange plans to issue a "soulbound" token on the BNB blockchain to all users who complete know-your-customer (KYC) requirements. Soulbound tokens, which act as an identity passport across the BNB blockchain, are unique and non-transferable. The tokens will allow users to participate in building projects while earning rewards. Users can opt out of the token if they prefer not to share their identity across the entire network. [Read more here.](#)

[A research report from Bank of America said the Merge may lead to greater institutional adoption of ether.](#)

- **WHY IT MATTERS:** The notable reduction in energy consumption after the Merge may allow some institutional investors, who are barred from buying tokens that run on proof-of-work systems, to purchase ether (ETH) for the first time, the report said. "The ability to stake ETH and generate a higher-quality yield (lower credit and liquidity risk) as a validator or through a staking service rather than on block-box lending/borrowing applications may also drive institutional adoption," analysts Alkesh Shah and Andrew Moss wrote. [Read more here.](#)

Welcome to Valid Points!

Last week, Ethereum made its [historic shift](#) from [proof-of-work to proof-of-stake](#) – officially abandoning the energy-intensive, miner-based system that it had previously used to process updates to its decentralized ledger.

In crypto circles, the occasion of the Merge was observed like a holiday – celebrated virtually and in person at watch parties complete with music, speeches and even some special guests.

The [largest Merge watch party](#) was sponsored by the Ethereum Foundation and featured talks from Ethereum co-founder Vitalik Buterin and other community leaders. It had 41,000 concurrent YouTube viewers at its peak.

The fact that the Merge happened overnight in much of the world only added to the excitement for many viewers. Staying up until 3 a.m. and waiting for Ethereum to finalize its first proof-of-stake blocks felt like waiting for the ball to drop in Times Square on New Year's Eve. In both cases excitement built up to a critical moment when – in just an instant – the world flickered from one reality to another.

But just as watching a crystal-studded disco ball slowly descend a pole feels a bit contrived, one couldn't help but feel a bit underwhelmed when, after years of waiting, a successful Merge was marked by blocky, difficult-to-decipher text on a black-and-white computer terminal. At least New Year's Eve had fireworks.

The network is, however, already showing signs of change.

— [Sam Kessler](#)

The Essay

Evaluating Ethereum: 1 Week After the Merge

The first and most obvious immediate impact of the Merge was the one that it had on the network's energy usage. Switching from mining to staking meant ripping out precisely the component of blockchain tech that gives it a bad environmental reputation.

Proof-of-stake's lottery-based system for proposing blocks is vastly more energy efficient than its power-hungry proof-of-work predecessor.

Justin Drake, a researcher at the Ethereum foundation, told CoinDesk he predicted that the Merge – by shifting the second-largest blockchain network to a more efficient mechanism – would decrease global energy use by 0.2%.

This statistic [has been disputed](#). In the short term, many Ethereum miners have found refuge on other networks, like Ethereum Classic, which continues to operate using proof-of-work. The movement of one-time Ethereum miners to these other chains has slightly damped the impact the Merge will have on decreasing overall crypto emissions.

But in the long term, mining on proof-of-work blockchains is unlikely to become profitable enough for most Ethereum mining outfits to continue operating.

Chandler Guo, the miner behind a controversial Ethereum [proof-of-work fork](#) (ETHW), admitted as much himself in an [interview with CoinDesk](#)'s "First Mover": "Some people [miners] have free electricity and can [continue] to work on the [\[ETHW chain\]](#)," Guo said. "The other 90%, bankrupt."

Moving to Bitcoin is not really an option either because the computer chips that are best suited to mining on Ethereum (GPUs) tend to be poor at mining on Bitcoin, whose miners typically use specialized computer chips called ASICs.

So while the immediate environmental impact of the Merge was blunted somewhat by the existence of other proof-of-work chains, its net-positive impact on emissions continues to look sunny.
